

Read the activity feed

Activity is the audit trail: every AI request your developers send through the Gateway, with the policy decision attached. The small dot beside the title means the view is updating live.

The four tiles

Requests and **Blocked** for the selected window, plus **Top models** and **Top MCP servers** — a quick read on what your team leans on.

The columns

Column	What it tells you
When	Request time
Developer	Who, and which tool (Claude Code, Cursor, Copilot...)
Model	The model actually used
Signals	Risk findings and MCP servers involved
Mode	<code>Subscription</code> (their own plan) or <code>API key</code> (your managed key)
Outcome	<code>OK</code> , <code>Blocked</code> , or an upstream error
Tokens / Duration	Size and latency

A **blocked** row is tinted and carries a red rail on the left, so it stands out when you're scanning rather than reading.

Filters

Time window, outcome, event type, developer, and a model filter. The common investigation — "show me everything blocked in the last 24 hours" — is two clicks.

Mode is worth understanding

`Subscription` means the developer's own AI subscription paid for that request and Sentilai only governed it. `API key` means it went through your organization's provider key and is billed to you. Both are audited identically;

the difference is who pays.
